What to do if you get a positive RATs test at work

If a worker is experiencing COVID-19 like symptoms the worker needs to undertake a PCR test and isolate at home until their results are returned.
 RATs produce on average 4 false positive results per 1000 tests. Work surveillance schemas should always confirm positive results with a PCR test and record the number of false positives.

New Zealand Government

- Nuclear receptor binding and activation assays [see Shah et al. (2011)]
- Metabolic assays [Wetmore et al. (2011), Rotroff et al. (2010), Pelkonen et al. (2009)]
- liver stem cell lines to explore the potential for effects of AHR activators on stem cell proliferation, intercellular communication or other tumour-related effects.
- Evaluate AHR responsiveness in other non-parenchymal cells (e.g., stellate cells) for possible modulatory effects or interactions with initiated hepatocytes or stem cells.

EAR from the *in vitro* assays would be a measure of the AC50 or half maximal assay concentration expressed as a human exposure level divided by the relevant human exposure level estimated from biomonitoring studies (see Wetmore et al., 2011)*
 *Notes: These two quantities would need to be expressed in the same units, e.g. subcutaneous dose, nasal concentration, etc.
